ABSTRACT OF THE DISCLOSURE

A system of order reexamination in an EDI (electronic data interchange). The system includes an EDI server, a message conversion server and an order reexamination system. The EDI server receives an EDI message and transfers it to the message conversion system and the order reexamination system. The message conversion system transforms the EDI message into a first electronic order. The order reexamination system parses the EDI message to generate a second electronic order group. The order reexamination system generates a notification if order IDs in the first electronic order group do not match the second electronic order group or the quantity of orders in the first electronic order group is different from that of the second electronic order group.
